

Bind™ Line for Internal and Surface Bonding

The manufacturing process of each sheet of paper takes into account its end use.

Whether it is paper for contact with food and beverages, for printing and writing, or for packaging, it must be prepared to resist contact with various agents, allow the correct penetration of adhesives in the production of boxes and envelopes, or not deform when exposed to inks in printing processes.

Mark's **Bind™** range of bonding agents is broad, efficient and innovative, offering both internal and surface bonding technologies, **AKD-based or hybrid**, which take into account the requirements of the end use of the sheet and act for optimum machine runnability and are highly cost competitive.

The **Bind™** Surface Bonding line, in addition to operational benefits such as excellent resistance to mechanical stress, control of porosity and better printability, adds sustainability, meeting Anvisa and FDA regulations for

use on food contact papers.

Relying on a multidisciplinary team with a comprehensive vision, Mark has versatility to develop innovative and viable solutions that respect the particularities and objectives of each process.

Skilled at diagnosing, implementing and monitoring solutions, Mark translates into results and suggestions for improvement each information collected in the process, demonstrating the benefits and strengthening the relationship of trust with the customer.

Contact our representative and get to know our solutions for internal and superficial bonding.
